MC74HC137

1-of-8 Decoder/Demultiplexer with Address Latch

High–Performance Silicon–Gate CMOS

The MC74HC137 is identical in pinout to the LS137. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

The HC137 decodes a three–bit Address to one–of–eight active–low outputs. The device has a transparent latch for storage of the Address. Two Chip Selects, one active–low and one active–high, are provided to facilitate the demultiplexing, cascading, and chip–selecting functions.

The demultiplexing function is accomplished by using the Address inputs to select the desired device output, and then by using one of the Chip Selects as a data input while holding the other one active.

The HC137 is the inverting version of the HC237.

- Output Drive Capability: 10 LSTTL Loads
- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2 to 6 V
- Low Input Current: 1 μA
- High Noise Immunity Characteristic of CMOS Devices
- In Compliance with the Requirements Defined by JEDEC Standard No. 7A
- Chip Complexity: 152 FETs or 38 Equivalent Gates

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high–impedance circuit. For proper operation, V_{in} and V_{out} should be constrained to the range GND ≤ (V_{in} or V_{out}) ≤ V_{CC}.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V_{CC}). Unused outputs must be left open.

* Maximum Ratings are those values beyond which damage to the device may occur.
Functional operation should be restricted to the Recommended Operating Conditions.

†Derating — Plastic DIP: – 10 mW/°C from 65° to 125°C
SOIC Package: – 7 mW/°C from 65° to 125°C

For high frequency or heavy load considerations, see Chapter 2 of the Motorola High–Speed CMOS Data Book (DL129/D).

PIN DESCRIPTIONS

ADDRESS INPUTS

A0, A1, A2 (Pins 1, 2, 3)

Address inputs. These inputs, when the chip is enabled, determine which of the eight outputs is selected.

CONTROL INPUTS

CS1, CS2 (Pins 6, 5)

Chip–Select inputs. For CS1 at a high level and CS2 at a low level, the chip is enabled and the outputs follow the address inputs (Latch Enable = L). For any other combination of CS1 and CS2, the outputs are at a high level.

Latch Enable (Pin 4)

Latch–Enable input. A high level at this input latches the Address. A low level at this input allows the outputs to follow the data at the Address pins (CS1 = H and CS2 = L).

OUTPUTS

Y0 – Y7

Active–low outputs. One of these eight outputs is selected when the chip is enabled (CS1 = H and CS2 = L) and the data on the A0, A1, and A2 inputs correspond to that particular output. The selected output is at a low level while all others remain at a high level.
