Octal buffer/line driver; 3-state 74LVC244

FEATURES

- **Wide supply voltage range of 1.2 V to 3.6 V**
- **In accordance with JEDEC standard no. 8-1A.**
- **Inputs accept voltages up to 5.5 V**
- **CMOS low power consumption**
- **Direct interface with TTL levels**
- **Output drive capability 50 Ω transmission lines @ 85 °C**

DESCRIPTION

The 74LVC244 is a high-performance, low-power, low-voltage, Si-gate CMOS device and superior to most advanced CMOS compatible TTL families.

Inputs can be driven from either 3.3 V or 5 V devices. This feature allows the use of these devices as translators in a mixed 3.3 V/5 V environment

The 74LVC244 is an octal non-inverting buffer/line driver with 3-state outputs. The 3-state outputs are controlled by the output enable inputs $1\overline{OE}$ and $2\overline{OE}$. A HIGH on $n\overline{OE}$ causes the outputs to assume a high impedance OFF-state. Schmitt-trigger action at all inputs makes the circuit highly tolerant for slower input rise and fall times. The '244' is identical to the '240' but has non-inverting outputs.

FUNCTION TABLE

INPUTS		OUTPUT
$n\overline{OE}$	nA_n	nY_n
L	L	L
L	H	H
H	X	Z

H = HIGH voltage level
L = LOW voltage level
X = don't care
Z = high impedance OFF-state

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; $t_r = t_f \leq 2.5$ ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL	UNIT
t_{PHL}/t_{PLH}	propagation delay $1A_n$ to $1Y_n$; $2A_n$ to $2Y_n$	C_L = 50 pF V_{CC} = 3.3 V	4.9	ns
C_I	input capacitance		5.0	pF
C_{PD}	power dissipation capacitance per buffer	notes 1 and 2	30	pF

Notes to the quick reference data

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW)
   $P_D = C_{PD} \times V_{CC}^2 \times f_i + \Sigma (C_L \times V_{CC}^2 \times f_o)$ where:
   f_i = input frequency in MHz; C_L = output load capacity in pF;
   f_o = output frequency in MHz; V_{CC} = supply voltage in V;
   $\Sigma (C_L \times V_{CC}^2 \times f_o)$ = sum of the outputs.
2. The condition is V_I = GND to V_{CC}

FAMILY DESCRIPTION

The LVC family comprises very fast low-power logic ICs fabricated in a sub-micron CMOS process.
LVC ICs with 3.3 V ±0.3 V supply operate at the same speed as FAST bipolar logic and consumes only a fraction of the power. The LVC family functions with supply voltages down to 2.7 V. The reduction from the conventional 5.0 V to 3.3 V reduces the output swing leading to a much lower dynamic power dissipation. Pin and function compatibility with FAST ensures an easy transfer of existing systems into new 3.3 V systems.

RECOMMENDED OPERATING CONDITIONS FOR THE LVC FAMILY

Notes to the limiting values

1. Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those under 'recommended operating conditions' is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.
2. The input and output voltage ratings may be exceeded if the input and output current ratings are observed.

SOLDERING

Plastic mini-packs

BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.
